

INSENSIV

„RVM 80“

The right solution for every task. Our reverse vending machines can be optimally adapted to your needs through a wide range of options and alternatives. No matter whether you want to handle beverage bottles, cans, glass bottles or coffee-to-go cups the RVM 80 is able to take back any type of container.

The machine can optionally be equipped with a diverter for separation into two different fractions. Different container types can thus be sorted and collected separately from each other. Additional packs can easily be added to the machine software at a later stage. The deposit value can be given out in different ways.

The compact and robust construction of the RVM 80 ensures a long service life and helps to reduce the need for maintenance or repair from day one. The inclined input shaft of the machine does not require a rotation function. It thus minimizes cleaning and personnel costs and guarantees functional reliability.

When it comes to the return of beverage containers, rely on the "Made in Germany" quality of INSENSIV!

Basic model:

- Maintenance-friendly technology with long service life
- Safety through precise shape recognition
- 7" LC touch display
- Filling level sensor
